

## Sensorless BLDC Fan Driver IC for High Temperature Applications

### FEATURES AND BENEFITS

- AEC-Q100 qualified
- Speed curve configuration via EEPROM
- I<sup>2</sup>C serial port
- Sinusoidal modulation for reduced audible noise and low vibration
- Sensorless (no Hall sensors required)
- Low R<sub>DS(ON)</sub> power MOSFETs
- PWM or analog speed input
- FG speed output
- Slew rate control
- Lock detection
- Soft start
- Low power standby mode
- Overcurrent protection
- Overvoltage protection

### PACKAGE:

Not to scale

28-contact QFN  
with exposed thermal pad  
and wettable flank  
5 mm × 5 mm × 0.90 mm  
(ET package)

### DESCRIPTION

The A89304 is a single-chip solution to address a wide range of cooling fan systems, including ADAS GPU/CPU cooling, infotainment, and HUD, as well as auxiliary cooling fans and pumps. It has a fully integrated sensorless sinusoidal algorithm with integrated closed-loop speed control; no software programming is required. This allows for system design in a very tiny footprint by having integrated MOSFETs and only 5 external components required. In addition, the A89304 eliminates the need for a microcontroller. The device embeds Allegro's innovative algorithms such as Zero Torque Position Detection (ZTPD) and Automatic Phase Advance. These features not only improve startup performance but also enhance motor efficiency at high speed.

The A89304 is available in a 28-contact 5 mm × 5 mm QFN with exposed thermal pad and wettable flank (suffix ET).

### APPLICATIONS

Thermal management for:

- ADAS CPU
- Lidar
- Radar
- Vision systems
- LED headlamp
- HUD
- Infotainment systems

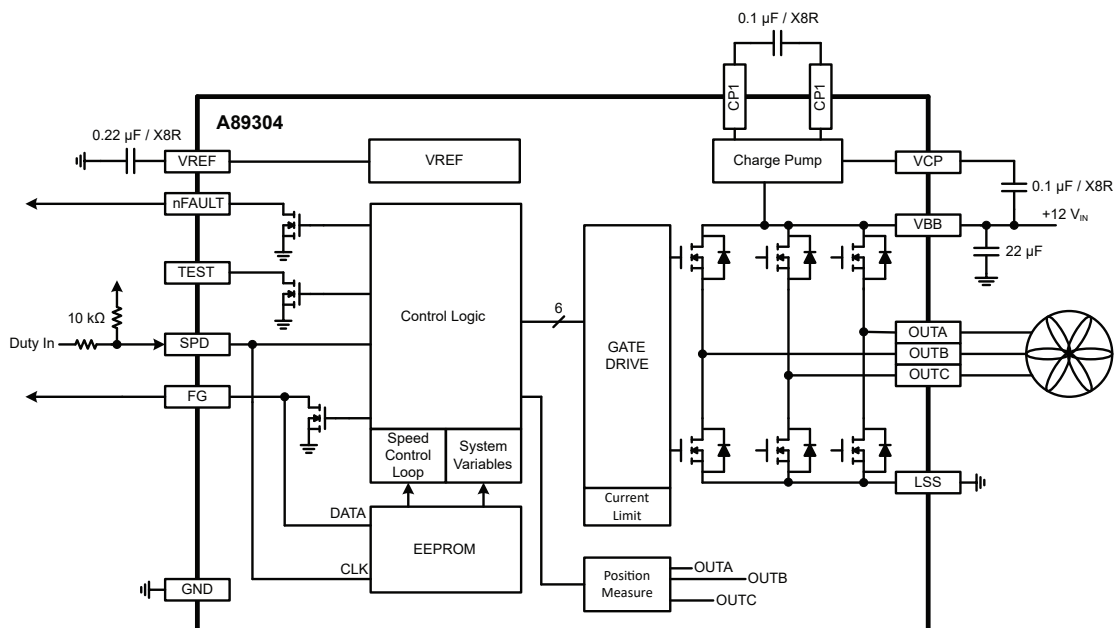

Figure 1: Typical Application

## SPECIFICATIONS

### SELECTION GUIDE

Part Number	Packaging	Packing
A89304KETJSR	28-contact QFN with exposed thermal pad and wettable flank	6000 pieces per 13-inch reel

### ABSOLUTE MAXIMUM RATINGS

Characteristic	Symbol	Notes	Rating	Unit
Supply Voltage	$V_{BB}$		-0.7 to 40	V
Logic Input Voltage Range	$V_{IN}$	SPD	-0.3 to 6	V
Logic Output	$V_O$	FG, nFAULT, TEST	-0.3 to 6	V
Output Current	$I_{OUT}$		3.6	A
Output Voltage	$V_{OUT}$	OUTA, OUTB, OUTC	$V_{BB} + 1$	V
VCP	$V_{CP}$		$V_{BB} - 0.3$ to $V_{BB} + 8$	V
CP1	$V_{CP1}$		-0.3 to $V_{BB} + 0.3$	V
CP2	$V_{CP2}$		$V_{BB} - 0.3$ to $V_{CP} + 0.3$	V
Maximum EEPROM write cycles	EEPROM <sub>W(MAX)</sub>		1000	cycles
Junction Temperature	$T_J$		150	°C
Storage Temperature Range	$T_{stg}$		-55 to 150	°C
Operating Temperature Range	$T_A$	Range K	-40 to 150	°C

### THERMAL CHARACTERISTICS

Characteristic	Symbol	Test Conditions*	Value	Unit
Package Thermal Resistance	$R_{\theta JA}$	28-contact QFN (package ET), on 2-sided PCB 1-in. <sup>2</sup> copper	40	°C/W

\*Additional thermal information available on the Allegro website.

### ET Package Pinouts

Terminal List Table

Number	Name	Function
19	GND	Ground
20,21,22	n/c	No connect
23	CP1	Charge pump capacitor
24	CP2	Charge pump capacitor
25	VCP	Charge pump capacitor
26	VBB	Input supply
27,28	n/c	No connect
1	OUTA	Motor terminal
2	n/c	No connect
3	LSS	Low side source connection
4	n/c	No connect
5	OUTB	Motor terminal
6	OUTC	Motor terminal
7,8,9,10,11	n/c	No connect
12	VREF	Reference voltage output
13	n/c	No connect
14	TEST	Logic output signal
15	nFAULT	Logic output signal
16	n/c	No connect
17	SPD	Logic input – speed demand
18	FG	Logic output signal
–	PAD	Exposed pad for enhanced thermal dissipation

**ELECTRICAL CHARACTERISTICS:** Valid for  $T_A = -40^\circ\text{C}$  to  $150^\circ\text{C}$ ,  $V_{BB} = 4$  to  $40$  V, unless noted otherwise

Characteristics	Symbol	Test Conditions	Min.	Typ.	Max.	Unit
<b>GENERAL</b>						
VBB Supply Current	$I_{BB}$	Active mode (PWM duty < DC_ON)	–	13.5	15	mA
	$I_{BBS}$	$V_{BB} = 34$ V, standby mode	–	10	50	$\mu\text{A}$
Reference Voltage	$V_{REF}$	$I = 0$ to $2$ mA, $V_{BB} = 6$ to $40$ V	3.15	3.3	3.45	V
Charge Pump	$V_{CP}$	Relative to $V_{BB}$ , $V_{BB} = 8$ V	6.5	7.2	7.7	V
		Relative to $V_{BB}$ , $V_{BB} = 4$ V	3.5	3.7	–	V
<b>POWER DRIVER</b>						
Total Driver On-Resistance (Sink + Source)	$R_{DS(ON)}$	$I = 1.5$ A, $T_J = 25^\circ\text{C}$ , $V_{BB} = 12$ V	–	510	–	m $\Omega$
		$I = 1.5$ A, $T_J = 150^\circ\text{C}$ , $V_{BB} = 12$ V	–	855	965	m $\Omega$
		$I = 1.5$ A, $T_J = 25^\circ\text{C}$ , $V_{BB} = 4$ V	–	680	–	m $\Omega$
		$I = 1.5$ A, $T_J = 150^\circ\text{C}$ , $V_{BB} = 4$ V	–	1070	1350	m $\Omega$
Source Driver On-Resistance	$R_{DS(ON)SRC}$	$T_J = 150^\circ\text{C}$ , $V_{BB} = 12$ V	–	428	–	m $\Omega$
Sink Driver On-Resistance	$R_{DS(ON)SNK}$	$T_J = 150^\circ\text{C}$ , $V_{BB} = 12$ V	–	428	–	m $\Omega$
Motor PWM Frequency	$f_{PWM}$		23.52	24.5	25.48	kHz
<b>SPEED CONTROL</b>						
PWM Input Frequency Range	$f_{PWMIN}$		34	–	65000	Hz
Duty Cycle On Threshold	DC_ON	Relative to target	–0.5	–	0.5	%
Duty Cycle Off Threshold	DC_OFF	Relative to target	–0.5	–	0.5	%
SPD Standby Threshold (Analog)	$V_{SPDTH}$		0.43	0.7	1	V
SPD On Threshold	$V_{SPDON}$	DC_ON = 10%	210	240	270	mV
SPD Off Threshold	$V_{SPDOFF}$	DC_OFF = 8%	160	190	220	mV
SPD Max	$V_{SPDMAX}$		–	2.49	–	V
SPD ADC Resolution	$V_{SPDLSB}$		–	4.892	–	mV
SPD ADC Accuracy	SPD_ACC	$V_{BB} = 12$ V, $V_{SPD} = 0.2$ V to $V_{SPDMAX}$	–10	–	10	LSB
Speed Setpoint	$f_{SPD}$	Duty cycle input	–5	–	5	%

[1] Specified limits are tested at a single temperature and assured over temperature range by design and characterization.

## FUNCTIONAL DESCRIPTION

### Basic Operation

The A89304 targets fan applications to meet the objectives of minimal vibration, high efficiency, and the ability to customize the IC to the speed control specification.

In typical systems, an MCU is required to meet each application specification. The A89304 integrates the basic closed-loop speed control function, thus allowing elimination of the cost, PCB space, and programming requirements of a custom MCU.

For each specific application, the EEPROM settings can be created with the Allegro EVB and software.

The speed of the fan is typically controlled by variable duty cycle PWM input. The duty cycle is measured and converted to a 9-bit number. This 9-bit “demand” is translated to a PWM duty cycle applied to the motor windings, effectively a percentage of the power supply voltage.

Protection features include lock detection with restart, overcurrent limit, overvoltage protection, motor output short circuit, supply undervoltage monitor, and thermal shutdown.

Standby mode can be achieved by holding SPD pin low for longer than the programmed lock off-time.

Figure 2: Sinusoidal Drive Sequence

**FG.** Open-drain output, represents the speed of the motor for normal operation. The electrical frequency of the motor may be different than FG output.

$$f_{ELEC} = f_{FGOUT} \times \text{NumberOfPolePairs} / 2$$

$$f_{FGOUT} = f_{ELEC} \times 2 / \text{NumberOfPolePairs}$$

$$RPM = f_{ELEC} \times 60 / \text{NumberOfPolePairs}$$

$$RPM = 30 \times f_{FGOUT}$$

Additionally, the FG pin serves as the data line, (SDA) for I<sup>2</sup>C communication.

**SPD.** Speed demand input. The demand can be in the form of duty cycle, analog voltage, or direct I<sup>2</sup>C command.

An EEPROM setting will determine choice of duty or analog input. Additionally, the SPD pin serves as the clock line (SCL) for I<sup>2</sup>C communication.

*Analog control.* Voltage applied to SPD pin will set speed demand. An internal 9-bit A/D converter will translate the input to a speed demand.

$$\text{Applied Duty (\%)} = \text{Code} / 511$$

$$\text{Code} = V_{IN(\text{SPD})} / 4.89 \text{ mV} + 2 \text{ where code} = [0 \dots 511]$$

**TEST.** Open drain output, low when motor off, high at end of open loop startup.

**nFAULT.** An active low output to represent the following fault conditions: VBB undervoltage, VBB overvoltage, thermal shutdown, VCP undervoltage, rotor lock, and output VDS fault (OCP).

**OCL.** Overcurrent limit. When the OCL level is reached, the PWM on pulses will be terminated early to prevent further increase of current.

**SLEW.** The motor output slew rate (dv/dt) can be reduced by adjustment of EEPROM variable SLEW.

SLEW		Nominal (ns)
MSB	LSB	
0	0	100
0	1	150

**OCP.** Overcurrent protection, VDS monitor. To protect from short-to-ground, shorted load, or short-to-battery conditions for the motor lines, the voltage across the power outputs is monitored at all times when the MOSFET is turned on. There will be a short blank time before the motor outputs are disabled if the overcurrent protection limit I<sub>OCP</sub> is exceeded. The fault is latched off. EEPROM bit OCPOPT will select option to reset latch with choice of lock timeout or PWM on/off command.

Note: During the shorted event, the absolute maximum ratings may be exceeded for the blank time.

**OVP.** The A89304 outputs can be disabled if power supply voltage exceeds programmed threshold. With OVPOPT = 1, the outputs will remain disabled for t<sub>LOCK</sub> to allow motor to coast down to slower speed. After t<sub>LOCK</sub>, a normal startup will resume operation assuming V<sub>BB</sub> has fallen below the hysteresis level.

VBBOV	VBBODIS	OVPOPT	OVPTH	OVP Function
X	1	1	Outputs continue to run with V <sub>BB</sub> > V <sub>BBOV</sub>	Disabled
0	X	0	19 V	Disable outputs when V <sub>BB</sub> > V <sub>BBOV</sub>
0	0	1	19 V	Latch off for t <sub>LOCK</sub>
1	X	0	38 V	Disable outputs when V <sub>BB</sub> > V <sub>BBOV</sub>
1	0	1	38 V	Latch off for t <sub>LOCK</sub>

**Standby Mode.** A low power mode is activated if SPD pin is held low. Standby Mode will turn off all circuitry including charge pump and VREF. Upon power up, the A89304 will immediately wake up. If SPD remains low for the programmed lock time, standby mode will be activated. Standby mode can be disabled via EEPROM bit.

**Lock Detect.** The A89304 will turn off for the programmed time (t<sub>LOCK</sub>) when the rotor is in a locked condition. A normal startup occurs after the lock timeout. EEPROM variable RETRY provides an option to count the number of lock events and prevent restart attempts after the count is exceeded. To resume operation after retry count is exceeded, PWM must be cycled OFF→ON. Lock event count can also be triggered by thermal shutdown events, OVP, or OCP events.

**Thermal Shutdown (TSD).** The A89304 protects itself from overheating with an internal thermal monitoring circuit. If the junction temperature exceeds the upper threshold T<sub>JTSD</sub>, the outputs will be disabled, and a lock timeout will be triggered. Device temperature must fall below the hysteresis level, ΔT<sub>J</sub>, to allow a normal restart sequence.

**EEPROM Security.** EEPROM can be password protected to prevent readback of the stored configuration. The IC will be shipped without password protection. Sequence to protect IC:

1. Power up.
2. Write 16-bit number to EEPROM register 7 per normal I<sup>2</sup>C EEPROM sequence.
3. Remember this password.
4. Power down.

### SERIAL PORT CONTROL OPTION

Normally the IC is controlled by duty cycle input and uses the EEPROM data that is stored to create the speed curve profile. However, it is possible to use direct serial port control to avoid programming EEPROM.

When using direct control, the input duty cycle command is replaced by writing a 9-bit number to register 165.

Example:

REGADDR[data]: (in decimal)

165[511] → Duty = 100%

165[102] → Duty =  $102 / 511 = 20\%$

Upon power up, the IC defaults to duty cycle input mode. To use serial port mode, the internal registers should be programmed before turning the part on. The sequence to use serial port mode is:

1. Drive FG and SPD pins low \*
2. Power-up IC
3. Program registers for parameter setting that correspond to each of the EEPROM memory locations.
  - A. REGADDR = 64 + EEPROM ADDR.
  - B. Program register addresses 72 to 94 corresponding to EEPROM addresses 8 to 30.
  - C. It may be helpful to use the GUI text file to help define the hex data for each of the EEPROM addresses.
4. Write to register 165 to start motor

\* Note: If SPD is not driven low before power up, motor will try to start immediately as the default high value will demand 100% on signal.

## I<sup>2</sup>C Control Registers

REG	Bits		Function	Description
165	[8:0]	r/w	Speed Demand Input	Duty (%) = code / 511
128	[8:0]	r	Duty applied	Actual demand to the motor windings
138	[7:0]	r	Die temp	Temp °C = 3 + (CODE – 133) / 2
144	[15:0]	r/w	Number of startup failures	Cleared by writing zero or powerup
145	[15:0]	r/w	Number of startup attempts	Cleared by writing zero or powerup
147	[9:0]		Fault Status	
	0	r	Low-side VDS A	
	1	r	Low-side VDS B	
	2	r	Low-side VDS C	
	3	r	High-side VDS A	
	4	r	High-side VDS B	
	5	r	High-side VDS C	
	6	r	TSD	
	7	r	Charge Pump UVLO	
	8	r	VBB UVLO	
	9	r	VBB Overvoltage	
148	[15:0]		Lock detect criteria	
	0	r	Switch Over Error	
	1	r	Too Slow	
	2	r	Too Fast	
	3	r	Out of Sync	
	4	r	Bad Acceleration	
	5	r	Windmill Error	
	6	r	Max Phase Advance	
	14:7		Unused	
	15	w	Clear	Write 1 to clear the latched faults

## Serial Port

The A89304 uses standard fast mode I<sup>2</sup>C serial port format to program the EEPROM or to control the IC speed serially. The serial port can be used for startup configuration, fault readback, direction control, or input duty request. The SPD pin functions as the clock (SCL) input, and the FG pin is the data line (SDA). No special sequence is needed to begin transferring data. If the motor is running, the FG may pull then data line low while trying to initialize into serial port mode. Once an I<sup>2</sup>C command is received, the SPD input is ignored, and the motor will turn off as if a PWM duty command of 0% was sent.

The A89304 7-bit slave address is 0x55.

## I<sup>2</sup>C Timing Diagrams

## Programming EEPROM

The A89304 contains 32 words of 16-bit length. The EEPROM is controlled with the following I<sup>2</sup>C registers. Refer to application note for EEPROM definition.

**Table 1: EEPROM Control – Register 161 (Used to control programming of EEPROM)**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	RD	WR	ER	EN

Bit	Name	Description
0	EN	Set EEPROM voltage required for writing or erasing
1	ER	Sets mode to erase
2	WR	Sets mode to write
3	RD	Sets mode to read
15:4	n/a	Do not use; always set to zero during programming process

**Table 2: EEPROM Address – Register 162 (Used to set the EEPROM address to be altered)**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	eeADDRESS				

Bit	Name	Description
4:0	eeADDRESS	Used to specify EEPROM address to be changed.
15:5	n/a	Do not use; always set to zero during programming process

**Table 3: EEPROM DataIn – Register 163 (Used to set the EEPROM new data to be programmed)**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
eeDATAIn															

Bit	Name	Description
15:0	eeDATAIn	Used to specify the new EEPROM data to be changed

**Table 4: DataOUT – Register 164 (Used for read operations)**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
eeDATAout															
Bit	Name	Description													
15:0	eeDATAout	Used to readback EEPROM data from address defined in register 162													

There are 3 basic commands: Read, Erase, and Write. To change the contents of a memory location, the word must be first erased. The EEPROM programming process (writing or erasing) takes 12 ms per word.

Each word must be written individually.

Example #1: Write EEPROM address 5 to 261 (0x0105)

- 1) Erase the word
  - I<sup>2</sup>C Write REGADDR[Data] ; comment
  - a. 162[5] ; set EEPROM address to erase
  - b. 163[0] ; set 0000 as Data In
  - c. 161[3] ; set control to Erase and Voltage High
  - d. Wait 12 ms ; requires 12 ms High Voltage Pulse to Write
- 2) Write the new data
  - a. 162[5] ; set EEPROM address to write
  - b. 163[261] ; set Data In = 261
  - c. 161[5] ; set control to Write and Set Voltage High
  - d. Wait 12 ms ; requires 12 ms High Voltage Pulse to Write

Example #2: Read EEPROM address 5 to confirm correct data properly programmed

- 1) Read the word
  - a. 5[I<sup>2</sup>C Read] ; set EEPROM address to read
