

**XtremeSense™ TMR Current Sensor
with Ultra-Low Noise and <1% Total Error**

Not for New Design

The CT425 is in production but has been determined to be NOT FOR NEW DESIGN. This classification indicates that sale of this device is currently restricted to existing customer applications. The device should not be purchased for new design applications because obsolescence in the near future is probable. Samples are no longer available.

Date of status change: March 28, 2025

Recommended Substitutions:

For existing customer transition, and for new customers or new applications, refer to [CT428](#).

NOTE: For detailed information on purchasing options, contact your local Allegro field applications engineer or sales representative.

Allegro MicroSystems reserves the right to make, from time to time, revisions to the anticipated product life cycle plan for a product to accommodate changes in production capabilities, alternative product availabilities, or market demand. The information included herein is believed to be accurate and reliable. However, Allegro MicroSystems assumes no responsibility for its use; nor for any infringements of patents or other rights of third parties which may result from its use.

XtremeSense™ TMR Current Sensor with Ultra-Low Noise and <1% Total Error

FEATURES AND BENEFITS

- Integrated contact current sensing for low to medium current ranges:
 - 0 to 20 A □ 0 to 50 A
 - ±20 A □ ±50 A
 - 0 to 30 A □ 0 to 65 A
 - ±30 A □ ±65 A
- Integrated current carrying conductor (CCC)
- Linear analog output voltage
- Total error output $\leq \pm 1.0\%$ FS
- 1 MHz bandwidth
- Response time: 300 ns
- UL/IEC 62368-1 and UL1577 certification
 - Rated isolation voltage: 3.5 kV_{RMS}
 - Working voltage for basic isolation: 560 V_{RMS}
 - Working voltage for reinforced isolation: 280 V_{RMS}
- Low noise: 9.0 to 13.5 mA_{RMS} @ $f_{BW} = 100$ kHz
- Supply voltage: 4.75 to 5.50 V
- Filter function to reduce noise on output pin
- Immunity to common mode fields: -54 dB
- AEC-Q100 grade 1
- 8-lead SOIC package

DESCRIPTION

The CT425 is a high bandwidth and ultra-low noise integrated contact current sensor that uses Allegro patented XtremeSense™ TMR technology to enable high accuracy current measurements for many industrial, consumer, and automotive applications. The device supports eight current ranges where the integrated current carrying conductor (CCC) will handle up to 65 A of current and generates a current measurement as a linear analog output voltage. The device achieves a total output error of less than $\pm 1.0\%$ full-scale (FS).

The device has a 300 ns output response time while the current consumption is ~ 6.0 mA and is immune to common mode fields. The CT425 has a filter function to reduce the noise on the output pin.

The CT425 is offered in an industry-standard 8-lead SOIC package that is green and RoHS compliant.

APPLICATIONS

- Solar/power inverters
- UPS, SMPS, and telecom power supplies
- Battery management systems
- Motor control
- White goods
- Power utility meter
- Overcurrent fault protection

PACKAGE:

8-lead SOIC

Not to scale

TÜV Certificate No.:
R 72226133 0001

UL Certificate No.:
UL-CA-2201235-0

ABSOLUTE MAXIMUM RATINGS ^[1]

Characteristic	Symbol	Notes	Rating	Unit
Supply Voltage Strength	V_{CC}		-0.3 to 6.0	V
Analog Input/Output Pins Maximum Voltage	$V_{I/O}$		-0.3 to $V_{CC} + 0.3$ ^[2]	V
Current Carrying Conductor Maximum Current	$I_{CCC(MAX)}$	$T_A = 25^{\circ}C$	70	A
Dielectric Surge Strength Test Voltage	V_{SURGE}	IEC 61000-4-5: Tested ± 5 Pulses at 2/60 seconds, 1.2 μs (rise) and 50 μs (width)	6.0 (min)	kV
Surge Strength Test Current	I_{SURGE}	Tested ± 5 Pulses at 3/60 seconds, 8.0 μs (rise) and 20 μs (width)	3.0 (min)	kA
Electrostatic Discharge Protection Level	ESD	Human Body Model (HBM) per JESD22-A114	± 2.0	kV
		Charged Device Model (CDM) per JESD22-C101	± 0.5	kV
Junction Temperature	T_J		-40 to 150	$^{\circ}C$
Storage Temperature	T_{STG}		-65 to 155	$^{\circ}C$
Lead Soldering Temperature	T_L	10 seconds	260	$^{\circ}C$

^[1] Stresses exceeding the absolute maximum ratings may damage the CT425 and may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

^[2] The lower of $V_{CC} + 0.3$ V or 6.0 V.

RECOMMENDED OPERATING CONDITIONS ^[1]

Characteristic	Symbol	Notes	Min.	Typ.	Max.	Unit
Supply Voltage Range	V_{CC}		4.75	5.00	5.50	V
Output Voltage Range	V_{OUT}		0	–	V_{CC}	V
Output Current	I_{OUT}		–	–	± 1.0	mA
Operating Ambient Temperature	T_A	Extended Industrial	-40	25	125	$^{\circ}C$
		Automotive	-40	25	125	$^{\circ}C$

^[1] The Recommended Operating Conditions table defines the conditions for actual operation of the CT425. Recommended operating conditions are specified to ensure optimal performance to the specifications. Allegro does not recommend exceeding them or designing to absolute maximum ratings.

ISOLATION RATINGS

Characteristic	Symbol	Notes	Rating	Unit
Impulse Withstand Voltage	$V_{IMPULSE}$	Tested ± 5 pulses at 2/minute in compliance to IEC 61000-4-5 1.2 μs (rise) / 50 μs (width)	5000	V_{PK}
Dielectric Withstand Voltage	V_{ISO}	Agency rated for 60 seconds per UL 62368-1:2014 (edition 2) and per UL 1577 ^[1]	3500	V_{RMS}
Working Voltage for Basic Isolation	V_{WVBI}	Maximum approved working voltage for basic insulation according to UL 62368-1:2014 (edition 2)	792	V_{PK}
			560	V_{RMS}
Working Voltage for Reinforced Isolation	V_{WBRI}	Maximum approved working voltage for reinforced insulation according to UL 62368-1:2014 (edition 2)	396	V_{PK}
			280	V_{RMS}
Creepage Distance	D_{CR}	Minimum distance along package body from IP leads to signal leads.	4	mm
Clearance Distance	D_{CL}	Minimum distance through air from IP leads to signal leads	4	mm
Distance Through Isolation	DTI	Minimum internal distance through isolation	110	μm
Comparative Tracking Index	CTI	Material Group II	400 to 599	V

[1] 100% Production-tested for 1 second in accordance with UL 62368-1 (edition 2) and UL 1577.

PINOUT DIAGRAM AND TERMINAL LIST

Figure 3: CT425 Pinout Diagram for 8-lead SOIC Package (Top-Down View)

Terminal List

Number	Name	Function
1, 2	IP+	Input primary conductor (positive).
3, 4	IP-	Output primary conductor (negative).
5	GND	Ground.
6	FILTER	Filter pin to improve noise performance by connecting an external capacitor to set the cut-off frequency. No connect if the FILTER pin is not used.
7	OUT	Analog output voltage that represents the measured current.
8	VCC	Supply voltage.

ELECTRICAL CHARACTERISTICS: Valid for $V_{CC} = 4.75$ to 5.50 V, $C_{BYP} = 1.0$ μ F, and $T_A = -40^\circ\text{C}$ to 125°C , typical values are $V_{CC} = 5.00$ V and $T_A = 25^\circ\text{C}$, unless otherwise specified

Characteristics	Symbol	Test Conditions	Min.	Typ.	Max.	Unit
POWER SUPPLIES						
Supply Current	I _{CC}	f _{BW} = 1 MHz, no load, I _P = 0 A	–	6.0	9.0	mA
OUT Maximum Drive Capability ^[1]	I _{OUT}	OUT covers 10% to 90% of V _{CC} span	–1.0	–	+1.0	mA
OUT Capacitive Load ^[1]	C _{L_OUT}		–	–	100	pF
OUT Resistive Load ^[1]	R _{L_OUT}		–	100	–	kΩ
Primary Conductor Resistance ^[1]	R _{IP}		–	1	–	mΩ
Power Supply Rejection Ratio ^[1]	PSRR		–	35	–	dB
Sensitivity Power Supply Rejection Ratio ^[1]	SPSRR		–	35	–	dB
Offset Power Supply Rejection Ratio ^[1]	OPSRR		–	40	–	dB
ANALOG OUTPUT (OUT)						
OUT Voltage Linear Range, Typical	V _{OUT}	V _{SIG_AC} = ±2.00 V, V _{SIG_DC} = +4.00 V	0.50	–	4.50	V

FUNCTIONAL DESCRIPTION

Overview

The CT425 is a high accuracy contact current sensor with an integrated current-carrying conductor that handles up to 65 A. It has high sensitivity and a wide dynamic range with excellent accuracy (low total output error) across temperature. This current sensor supports eight current ranges:

- 0 to 20 A
- ±20 A
- 0 to 30 A
- ±30 A
- 0 to 50 A
- ±50 A
- 0 to 65 A
- ±65 A

When current is flowing through the current-carrying conductor, the XtremeSense TMR sensors inside the chip senses the field which in turn generates differential voltage signals that then goes through the Analog Front-End (AFE) to output a current measurement with less than ±1.0% full-scale total output error (E_{OUT}).

The chip is designed to enable a fast response time of 300 ns for the current measurement from the OUT pin as the bandwidth for the CT425 is 1.0 MHz. Even with a high bandwidth, the chip consumes a minimal amount of power.

Linear Output Current Measurement

The CT425 provides a continuous linear analog output voltage which represents the current measurement. The output voltage range of OUT is from 0.50 to 4.50 V with a V_{OQ} of 0.50 V and 2.50 V for unidirectional and bidirectional currents, respectively. Figure 12 illustrates the output voltage range of the OUT pin as a function of the measured current.

Figure 12: Linear Output Voltage Range (OUT) vs. Measured Current (IP)

Filter Function (FILTER)

The CT425 has a pin for the FILTER function which will enable it to improve the noise performance by changing the cutoff frequency. The bandwidth of the CT425 is 1.0 MHz; however, adding a capacitor to the FILTER pin—which will be in-series with an internal resistance of approximately 15 k Ω —will set the cutoff frequency to reduce noise.

Experimentally measured Bandwidth does not necessarily match the calculated bandwidth value obtained by using the equation $f_{BW} = 1/2\pi RC$ because of the parasitic capacitances due to PCB manufacturing and layout. This is further impacted by the small, picofarad level C_{FILTER} recommendations.

Figure 13: Experimental Bandwidth vs. C_{FILTER}

Sensitivity

Sensitivity (S) is a change in the CT425 output in response to a change in 1 A of current flowing through the current-carrying conductor. It is defined by the product of the magnetic circuit sensitivity (G/A, where 1.0 G = 0.1 mT) and the chip linear amplifier gain (mV/G). Therefore, the result of this gives a sensitivity unit of mV/A. The CT425 is factory-calibrated to optimize the sensitivity for the full scale of the device dynamic range.

Total Output Error

The Total Output Error (E_{OUT}) is the maximum deviation of the sensor output from the ideal sensor transfer curve over the full temperature range relative to the sensor full scale.

The Total Output Error is measured by performing a full-scale primary current (IP) sweep and measuring V_{OUT} at multiple points.

$$E_{OUT} = 100 * \frac{\max(V_{OUT_{IDEAL}}(I) - V_{OUT}(I))}{F.S.}$$

The Ideal Transfer Curve is calculated based on datasheet parameters as described below.

$$V_{OUT_{IDEAL}}(I_P) = V_{OQ} + S * I_P$$

E_{OUT} incorporates all sources of error and is a function of the sensed current (I_P) from the current sensor.

Figure 14: Total Output Error (E_{OUT}) vs. Sensed Current (I_P)

The CT425 achieves a total output error (E_{OUT}) that is less than $\pm 1.0\%$ of Full-Scale (FS) over supply voltage and temperature. It is designed with innovative and proprietary TMR sensors and circuit blocks to provide very accurate current measurements regardless of the operating conditions.

Sensitivity Error

The sensitivity error (E_{SENS}) is the sensitivity temperature drift error for unipolar or DC current. It is calculated using the equation below:

$$E_{SENS} = 100 * \left(\frac{S_{MEASURED}}{S} - 1 \right)$$

For bipolar or AC current, the E_{SENS} is calculated by dividing the equation by 2.

Power-On Time (t_{ON})

Power-On Time (t_{ON}) of 100 μs is the amount of time required by CT425 to start up, fully power the chip, and becoming fully operational from the moment the supply voltage is applied to it. This time includes the ramp-up time and the settling time (within 10% of steady-state voltage under an applied magnetic field) after the power supply has reached the minimum V_{CC} .

Response Time ($t_{RESPONSE}$)

Response Time ($t_{RESPONSE}$) of 300 ns for the CT425 is the time interval between the following terms:

1. When the primary current signal reaches 90% of its final value,
2. When the chip reaches 90% of its output corresponding to the applied current.

Figure 15: CT425 Response Time Curve

Rise Time (t_{RISE})

Rise Time (t_{RISE}) is the time interval of when it reaches 10% and 90% of the full-scale output voltage. The t_{RISE} of the CT425 is 200 ns.

Propagation Delay (t_{DELAY})

Propagation Delay (t_{DELAY}) is the time difference between these two events:

1. When the primary current reaches 20% of its final value
2. When the chip reaches 20% of its output corresponding to the applied current.

The CT425 has a propagation delay of 250 ns.

Figure 16: CT425 Propagation Delay and Rise Time Curve

Undervoltage Lockout (UVLO)

The Undervoltage Lockout protection circuitry of the CT425 is activated when the supply voltage (V_{CC}) falls below 2.45 V. The CT425 remains in a low quiescent state until V_{CC} rises above the UVLO threshold (2.50 V). In this condition where V_{CC} is less than 2.45 V and UVLO is triggered, the output from the CT425 is not valid.

Immunity to Common Mode Fields

The CT425 is housed in a custom plastic package that uses a U-shaped leadframe to reduce the common mode fields generated as current flows through the current-carrying conductor. With the U-shaped leadframe, the stray fields cancel one another thus reducing electromagnetic interference (EMI).

Also, a good PCB layout of the CT425 will optimize performance and reduce EMI. See the Applications Information section in this datasheet for recommendations on PCB layout.

Creepage and Clearance

Two important terms as it relates to isolation provided by the package are: creepage and clearance. Creepage is defined as the shortest distance across the surface of the package from one side the leads to the other side of the leads. The definition for clearance is the shortest distance between the leads of opposite side through the air.

Application

The CT425 is an integrated contact current sensor that can be used in many applications from measuring current in power supplies to motor control to overcurrent fault protection. It is a plug-and-play solution in that no calibration is required, and it outputs to a microcontroller a simple linear analog output voltage which corresponds to a current measurement value.

It is designed to support an operating voltage range of 4.75 to 5.50 V, but it is ideal to use a 5.0 V power supply where the output tolerance is less than $\pm 5\%$.

Bypass Capacitor

A single 1.0 μF capacitor is needed for the VCC pin to reduce the noise from the power supply and other circuits. This capacitor should be placed as close as possible to the CT425 to minimize inductance and resistance between the two devices.

Filter Capacitor

A capacitor may be added to the FILTER pin of the CT425 if there is a requirement to improve the noise performance. The capacitor will be connected to an internal resistor of 15 $\text{k}\Omega$ inside the chip to form a R-C filter. This R-C filter produces a cutoff frequency that will reduce the noise over this lower bandwidth.

If the filtering function is not required, then the FILTER pin should be left unconnected (No Connect).

Recommended PCB Layout

Since the CT425 can measure up to 65 A of current, special care must be taken in the printed circuit board (PCB) layout of the CT425 and the surrounding circuitry. It is recommended that the CCC pins be connected to as much copper area as possible. It is also recommended that 2 oz. or heavier copper be used for PCB traces when the CT425 is used to measure up to 30 A of current. Additional layers of the PCB should also be used to carry current and be connected using the arrangement of vias. Figure 17 and Figure 18 show the recommended the PCB layout for the 20 A and 30 A variants of CT425. For the 65 A variant, it is recommended that 4 oz. of copper be used for the PCB traces.

Figure 17: Recommended PCB Layout (Top Layer) for the 20 A to 65 A variants of the CT425

Figure 18: Recommended PCB Layout (Bottom Layer) for the 20 A to 65 A variants of the CT425

Thermal Rise vs. Primary Current

Self-heating due to the flow of current should be considered during the design of any current sensing system. The sensor, printed circuit board (PCB), and contacts to the PCB will generate heat as current moves through the system.

The thermal response is highly dependent on PCB layout, copper thickness, cooling techniques, and the profile of the injected current.

The current profile includes peak current, current on-time, and duty cycle. While the data presented in this section was collected with direct current (DC), these numbers may be used to approximate thermal response for both AC signals and current pulses.

The plot in Figure 19 shows the measured rise in steady-state die temperature of the current sensor versus continuous current at an ambient temperature, T_A , of 25 °C. The thermal offset curves may be directly applied to other values of T_A .

[1] RoHS is defined as semiconductor products that are compliant to the current EU RoHS requirements. It also will meet the requirement that RoHS substances do not exceed 0.1% by weight in homogeneous materials. Green is defined as the content of chlorine (Cl), bromine (Br), and antimony trioxide based flame retardants satisfy JS709B low halogen requirements of $\leq 1,000$ ppm.

[2] MSL Rating = Moisture Sensitivity Level Rating as defined by JEDEC standard classifications.

[3] Package will withstand ambient temperature range of –40°C to 125°C and storage temperature range of –65°C to 150°C.

[4] Device Marking for CT425 is defined as CT425 S8xxZR YYWWLL where the first 2 lines = part number, YY = year, WW = work week, and LL = lot code.
